Roadmap Horizon

Executive Summary

Castaway is a multi-tenant SaaS platform for reality TV fantasy leagues, currently live with Survivor Season 50 as the flagship tenant. The platform covers the full lifecycle of a fantasy season: draft, event tracking, scoring, leaderboards, and season management — all backed by a robust admin toolchain and a Monte Carlo simulation engine.

Two sprints are complete or in progress. The foundation is solid and production-ready. The next six months focus on completing the merge/finale gameplay features for Season 50, then expanding into multi-season support and new engagement features ahead of Season 51.

Where We Are — Completed Features

Core Platform

The platform is fully operational in production on Railway. Every core gameplay loop is live: users authenticate via Clerk, run a snake draft, watch real-time scoring update the leaderboard as events are approved, and manage their teams throughout the season.

Feature	What It Does	Status
Authentication & Teams	Clerk-powered auth, 1:1 user-to-team, invite codes	■ Done
Snake Draft	Admin-configured order, real-time pick progression	■ Done
Event System	Structured GameEvent submission, admin approval flow, Slack notifications	■ Done
Scoring Engine	Zero-storage calc from approved events, 15 event types, weekly breakdowns	■ Done
Leaderboard	Live recalculation, scoring info dialog, category breakdowns	■ Done
Admin Dashboard	User mgmt, contestant CRUD, episode tracking, event review, league settings	■ Done
PWA Support	Installable, offline-capable via Serwist service worker	■ Done
Simulation Engine	Monte Carlo draft analysis, A/B scoring comparison, zero app deps	■ Done
Season Management	Contestants, episodes, tribes, readiness checks	■ Done
Tribe Swap	Timeline tracking, bulk membership, admin UI, dynamic leaderboard tribes	■ Done
Feature Flags	Runtime toggles for experimental features, admin UI	■ Done

Feature	What It Does	Status
Guest Access & Privacy	Configurable league visibility, public read paths	■ Done
Stripe Payments	Checkout flow for paid league access	■ Done
Multi-Tenant Schema	Show / Season / League / Membership models, backfill migrations	■ Done

In Progress — Sprint 2: Multi-Tenancy

Sprint 2 is actively underway. The goal is to fully scope all data access through league context helpers so any new tenant can be onboarded by slug without code changes. The legacy Season 50 league continues to operate throughout this migration.

Task	Description	Status
League Context Helpers	getLeagueBySlug / getLegacyLeague / requireLeagueBySlug APIs	■ Done
Slug-Scoped Routing	All API routes migrated from bare findFirst() to league-context helpers	■ In Progress
Auth + Middleware Scoping	Clerk middleware, route protection scoped to League.slug	■ In Progress
Tenant Onboarding Flow	Self-serve league creation, invite system per tenant	■ Upcoming

Next Up — Season 50 Merge & Finale Features

With the pre-merge season gameplay complete, the next development block delivers the post-merge experience — individual immunity, reward challenges, fire-making, jury tracking, and the finale outcome submission. These features are required before the Season 50 merge episode airs.

Feature Area	Key Deliverables	Status
Merge Detection	isMerge tribe flag, merge week utility, admin merge setup wizard	■ Upcoming
Individual Immunity	Post-merge standalone immunity tracking, single-winner validation	■ Upcoming
Reward Challenges	Multi-winner reward form, REWARD_CHALLENGE_WIN scoring (3 pts/winner)	■ Upcoming
Fire-Making Challenge	FIRE_MAKING_WIN event (5 pts), finale week integration	■ Upcoming
Jury & Finale Events	MADE_JURY (5 pts), FINALIST (10 pts), WINNER (20 pts), admin finale form	■ Upcoming
Post-Merge UI	Merge tribe styling on leaderboard, jury member badges, event form gating	■ Upcoming
Business Logic Guards	Prevent pre-merge events post-merge and vice versa, finale validation	■ Upcoming

6-Month Horizon — Platform Expansion

Once Season 50 is fully supported, the platform expands beyond a single season. The multi-tenant infrastructure already built in Sprint 1 positions Castaway to support multiple shows, multiple seasons, and new engagement mechanics that drive retention and monetization.

Theme	Initiatives	Target
Multi-Season & Multi-Show	Season archive & history, Season 51+ onboarding, carryover/keeper leagues, show-agnostic season config	Q3 2026
Engagement	Live scoring updates during episodes, push notifications for major events, team trash talk & comments, weekly prediction game (bonus points)	Q3–Q4 2026
Analytics	Historical player performance across seasons, draft ADP vs actual points, trade/waiver system	Q4 2026
Mobile	Native mobile app (React Native or Capacitor), expanding on existing PWA foundation	Q4 2026
Platform Reliability	Comprehensive E2E test coverage for merge scenarios, performance optimization for large event datasets	Q3 2026

Visual Timeline

NOW Sprint 2 Multi-Tenancy	NEXT Merge & Finale Features	Q3 2026 Multi-Season Expansion	Q4 2026 Engagement & Mobile
Auth + routing scoped by slug	Individual immunity, jury, fire-making, finale forms	Season 51+ support, archive, show-agnostic config	Push notifications, trade system, native app

Technical Foundation

Castaway is built on a modern, battle-tested stack purpose-built for rapid iteration and production reliability. Every layer is managed-service or open-source, keeping operational overhead low.

Layer	Technology	Why We Chose It
Frontend	Next.js 16 App Router + React 19	Server components, streaming, best-in-class DX
Styling	Tailwind v4 + shadcn/ui	Rapid UI iteration, accessible primitives
Auth	Clerk	Managed auth, webhooks for user sync, roles in metadata
Database	Prisma 7 + PostgreSQL 16	Type-safe ORM, strong migrations, proven relational model
Infra	Railway	Zero-config deploy, managed Postgres, health checks
Payments	Stripe	Industry-standard checkout, minimal integration surface
Notifications	Slack Webhooks	Instant event alerts to league channels
Testing	Vitest (unit) + Playwright (E2E)	116 unit tests passing, no DB required for CI
Simulation	Custom Monte Carlo Engine	Zero app-layer deps, draft strategy analysis at scale

Architecture Highlights

Invariant	Detail
Scores Never Stored	All points are calculated at runtime from approved Event rows via EVENT_POINTS constants. No score columns in the DB — leaderboard always reflects current ground truth.
Event Derivation	Admins submit structured GameEvents (e.g. Tribal Council with votes + idol data). deriveEvents() explodes these into individual scoring Events automatically.
Two Scoring Sources of Truth	scoring.ts (app) and the simulation engine's data-mapper.ts both maintain point values independently — by design to keep the sim engine dependency-free.
Multi-Tenant by Slug	Every league is addressed by a slug. All data access routes through getLeagueBySlug() / getLegacyLeague() — no bare DB queries for league resolution.
